3

(Proceedings delayed)

4

(10.05 am)

5

THE CHAIRMAN: Good morning.

6

Mr Di Rollo, you have to begin?

7

Submissions by MR DI ROLLO

8

MR DI ROLLO: Thank you, sir. I think the first thing that

9

I have to do is to say something about our approach to

10

written submissions.

11

As requested, by you, sir, we were required to make

12

written submissions which were to be with the Inquiry on

13

Monday of this week.

14

We have made substantive submissions in relation to

15

most of the topics covered in the public hearings,

16

starting with the four deaths.

17

In relation to these, the submissions used the model

18

of a determination under the Fatal Accidents and Sudden

19

Deaths Inquiry (Scotland) Act 1976. In relation to the

20

other topics, we have followed the structure set out by

21

you, sir, at the hearing on 30 October 2011.

22

The documents have been placed in court book and

23

I should indicate the numbers, I think, so that they can

24

be accessed from the transcript.

25

Our submission in respect of the four deaths: first

1 of all, [\[PEN0190773\]](#) is the Reverend David Black;  
2 [\[PEN0190777\]](#), Mr Laing; [\[PEN0190779\]](#), Mrs O'Hara and  
3 [\[PEN0190783\]](#), Mr Tamburrini.

4 The list of issues for the patient interests is  
5 [\[PEN0190806\]](#). And our submissions in respect of those  
6 are, in respect of B1, [\[PEN0190466\]](#), B2, [\[PEN0190476\]](#),  
7 B4, [\[PEN0190552\]](#), B5 [\[PEN0190571\]](#), B6, [\[PEN0190593\]](#), C1,  
8 [\[PEN0190600\]](#), C2, [\[PEN0190605\]](#). C3A, [\[PEN0190657\]](#), C4,  
9 [\[PEN0190712\]](#), C5, [\[PEN0190742\]](#) and C6, [\[PEN0190761\]](#).

10 Sir, we have attempted to answer the questions posed  
11 in our issues. We have, of course, done so from the  
12 perspective of patients, relatives and the Haemophilia  
13 Society. What is stated is intended to provide the  
14 Inquiry with a point of view in relation to the evidence  
15 on these topics.

16 We have tried to be as thorough as we possibly can  
17 taking into account all of the material made available.  
18 Throughout, we have tried to support what is stated with  
19 references to the testimonies, statements and documents.  
20 We very much hope that the Inquiry will find our  
21 submissions of assistance in the preparation of the  
22 final report.

23 There are three topics in relation to which we have  
24 not made a submission. These are statistics and the two  
25 viral inactivation topics, B3 and C3.

1           Statistics is a topic that we would wish an  
2           opportunity to make a submission on once the Inquiry has  
3           made available all the material which will form the  
4           basis of its analysis.

5           In relation to B3 and C3, what I would like to say  
6           is that it is of course in everyone's interests that  
7           term of reference 12, "to report as soon as  
8           practicable", is observed. We understand the need for  
9           a tight deadline for the production of submissions by  
10          the core participants, and as the deadline for  
11          submissions approached, we concentrated our efforts on  
12          certain areas of particular concern.

13          I took the decision that it was not necessary to put  
14          in a response in relation to C3 and B3, having regard to  
15          the absence of any real controversy in the evidence on  
16          these topics during the public hearings. We have posed  
17          certain questions in the issues lodged by us, and I hope  
18          these provide an indication of some of the points to be  
19          considered by the Inquiry in the final report.

20          Before finishing, in relation to our submissions,  
21          I think now would be an appropriate point, for my part,  
22          and I think on behalf of the other core participants, to  
23          thank the very exceptionally helpful treatment we have  
24          received from those in charge of the documents, Neil,  
25          Oliver and Keith, and also from the secretary and deputy

1 secretary of the Inquiry team, Maria and Sarah, and also  
2 Margaret who looked after the witnesses. I would also  
3 like to thank, on behalf of the core participants, our  
4 stenographers, Stuart and Catherine.

5 Thank you, sir.

6 THE CHAIRMAN: Yes, Mr Anderson?

7 Submissions by MR ANDERSON

8 MR ANDERSON: Yes, sir. In relation to the submissions, you  
9 will be aware that I represent the interests of both the  
10 SNBTS and also the Scottish health boards who, of  
11 course, employed the haemophilia clinicians at the  
12 relevant time.

13 You will also be aware that, although I have had the  
14 excellent support of the solicitors from the Central  
15 Legal Office, I don't have a junior counsel. So the  
16 submissions, as you will no doubt appreciate, have been  
17 divided up.

18 I have been responsible for drafting those  
19 submissions on behalf the health boards and a couple of  
20 those on behalf of the SNBTS. The others within the  
21 SNBTS have been the work of individuals within that  
22 organisation and have been vetted and revised by the  
23 legal representatives.

24 The approach taken to the submissions was not to  
25 answer every question posed by every core participant

1 but rather to seek to concentrate upon those areas where  
2 it was felt that there was the potential for some  
3 controversy, and in this regard we have taken the lead,  
4 largely but not exclusively, from the questions posed by  
5 Inquiry counsel and sought to answer those in a way that  
6 it is hoped will be of assistance to you in determining  
7 the final report.

8 I would simply seek to associate myself with the  
9 sentiments expressed by my learned friend Mr Di Rollo in  
10 thanking all those concerned.

11 THE CHAIRMAN: Mr Johnston?

12 MR JOHNSTON: Thank you, sir.

13 The Scottish Government submissions appear at  
14 [\[PEN0190274\]](#).

15 THE CHAIRMAN: Mr Johnston, excuse me just a moment. It has  
16 been drawn to my attention that Mr Anderson has not  
17 followed the practice of reading in the numbers, and  
18 that might be helpful, as Mr Di Rollo has done, in order  
19 that people can link through to them. I am sorry for  
20 interrupting you but we should get all of those.

21 MR ANDERSON: My apologies, sir. All the documents have the  
22 preface "PEN019".

23 The introduction is [\[PEN0190355\]](#), issue one is  
24 [\[PEN0190360\]](#), issue 2 is [\[PEN0190401\]](#), issue 3 and issue  
25 4 are [\[PEN0190428\]](#). Issue 5 is [\[PEN0190439\]](#). Issue 6

1 is [\[PEN0190447\]](#) and the methodology of the collective  
2 response is [\[PEN0190454\]](#). And finally the list of  
3 issues is [\[PEN0190805\]](#).

4 Submissions by MR JOHNSTON

5 THE CHAIRMAN: Mr Johnston, if I can start you afresh.

6 MR JOHNSTON: Thank you, sir.

7 I'll just repeat what I said, which is that the  
8 Scottish Government submissions appear at [\[PEN0190274\]](#).

9 In the written submissions the Government does not  
10 attempt to address every issue raised by the Inquiry  
11 team but it does try to cover all of those that  
12 particular affect the government as a core participant.

13 So for that reason, the introduction deals with the  
14 administrative structures that were in place for  
15 obtaining advice and formulating policy and guidance,  
16 and for providing the necessary resources to the  
17 Scottish National Blood Transfusion Service.

18 In addition, the introduction deals with the  
19 standard of scrutiny that it is thought appropriate for  
20 reviewing decision decisions that were taken in the  
21 reference period for the Inquiry.

22 So far as the specific topics that have been  
23 investigated are concerned, the Government submissions  
24 follow the order of the topics which the Inquiry team  
25 identified. Here, they don't attempt to grapple with

1 the difficult issues of science and medicine, or to  
2 enter into questions that are thought to be properly  
3 matters between doctor and patient, but rather they  
4 focus on issues that particularly affect the Government,  
5 such as the provision of necessary support and resources  
6 for the blood transfusion service and the way in which  
7 policy was formulated and communicated.

8 So I hope, beyond that, the submissions can speak  
9 for themselves, and I would simply like also to  
10 associate ourselves with the thanks that Mr Di Rollo  
11 expressed earlier.

12 THE CHAIRMAN: And you have a single document that you have  
13 given the reference number for?

14 MR JOHNSTON: Yes, that's correct.

15 THE CHAIRMAN: Thank you very much.

16 Mr Di Rollo, we move to the second phase of today's  
17 business, when you have the opportunity to make  
18 a closing statement.

19 Submissions by MR DI ROLLO

20 MR DI ROLLO: Thank you, sir.

21 On behalf of the patient and relative core  
22 participants and on behalf the Haemophilia Society,  
23 I would like to make some remarks at the conclusion of  
24 the public hearing phase of this Inquiry.

25 The first matter I would like to address is the need

1 for this process. The process that we have been engaged  
2 in is designed to provide answers to questions  
3 concerning a very complicated series of events that  
4 occurred over many years from at least 1974 right up  
5 until the present day.

6 Countless hours have been devoted to considering  
7 a truly awesome quantity of material. There should be  
8 no doubt that you, sir, and your brilliant team fully  
9 understand the importance of this process to the many  
10 thousands of people whose lives have been deeply  
11 affected, either by the loss of a loved one or in so  
12 many other ways by the twin tragedies of infection with  
13 Human Immunodeficiency Virus and the Hepatitis C virus  
14 as a result of treatment with blood or blood products by  
15 the NHS in Scotland.

16 Those lives include not just the patients and their  
17 families but also the many dedicated professionals  
18 responsible for all aspects of the blood transfusion  
19 service and for the treatment of patients throughout the  
20 period. This last aspect is perhaps more apparent after  
21 the public hearings than it was before.

22 It is axiomatic that twin disasters such as HIV and  
23 the Hepatitis C, as traumatic and far reaching as they  
24 are, should be the subject of some form of official  
25 public Inquiry. It is a pity that, because of the

1 surprising and disappointing failure by Government until  
2 now to appreciate the need for a detailed official  
3 public examination of the facts, evidence has been lost,  
4 witnesses have died and memories have faded.

5 On the other hand, it is still possible to  
6 reconstruct a great deal from the testimonies and  
7 documents that are available, and it is clear from the  
8 material that some of the key players appreciated the  
9 likelihood that a retrospective would one day be  
10 necessary and so recorded and made available much  
11 information with that in mind.

12 The Inquiry has investigated a number of topics in  
13 the course of this phase and the final report will  
14 hopefully contain many of the answers sought.

15 Some of the answers are relatively straightforward  
16 but nonetheless need to be set out with clarity. Some  
17 answers are more complicated, although not necessarily  
18 controversial, and it is to be hoped that it will be  
19 possible to explain these matters in a way that is  
20 accessible and comprehensible to the layman.

21 An attempt has to be made to answer more  
22 controversial issues. It is inevitable that at the end  
23 of the process, with the best will in the world, it may  
24 not be possible to provide a complete answer to all of  
25 the questions. But even the exercise of narrating that

1 state of affairs in relation to such questions has  
2 a value for those involved.

3 I have referred to the disasters of HIV and  
4 Hepatitis C as "twins", but they are not identical  
5 twins. One of the important tasks of the Inquiry is to  
6 understand, explain and highlight the differences as  
7 well as the similarities of the disasters, and the  
8 impact each had upon the other.

9 I would like to say something now about the nature  
10 of the process, and what I have to say applies to the  
11 whole of the Inquiry as opposed simply just to the  
12 public hearing phase with which we have been involved.

13 In some ways it's easier to characterise the nature  
14 of the Inquiry by saying what it is not. It is most  
15 certainly not a civil litigation. There is no place for  
16 legal concepts such as the standard of care, fault and  
17 causation, or even for concepts borrowed from  
18 administrative law.

19 The search for answers is not about pointing the  
20 finger or attributing blame, although it will no doubt  
21 be necessary to criticise certain decisions as mistaken,  
22 incorrect or wrong, just as other decisions were  
23 fortunate or sensible or wise.

24 Explaining what occurred in clear terms and  
25 acknowledging decisions good and bad is important. Our

1 understanding is that the Inquiry's intention is to  
2 examine decision-making at a strategic level rather than  
3 scrutinising decisions of particular individuals.

4 If that is so, one wonders: why all this  
5 defensiveness? Why is it so hard for institutions like  
6 the NHS and Government departments responsible for its  
7 administration to admit publicly mistakes and  
8 misjudgments? If the submissions on behalf of the NHS  
9 and Scottish Government are to be taken at face value,  
10 then no mistakes were made, no regret is expressed and  
11 communication with patients was as good as it possibly  
12 could have been.

13 Such defensiveness is not helpful but it is also not  
14 necessary, given the nature of the project in which we  
15 are all engaged. A fearless recognition, where  
16 appropriate, that mistakes were made would be so much  
17 more constructive and beneficial for everyone.

18 More than anything, this process will have a value  
19 if it can repair some of the mistrust that was created  
20 by unrealistic expectations, a lack of transparency,  
21 a failure to communicate effectively and an  
22 unwillingness to be upfront if relations to the threat  
23 posed by the risks that were present.

24 One of the those important themes to emerge is the  
25 difficulty of effective communication, not just between

1 doctors and nurses on the one hand and patients on the  
2 other, but also between organs of central government and  
3 the transfusion service, and within the transfusion  
4 service itself.

5 I will return to the theme of communication in a few  
6 moments.

7 I would like now to make some remarks about the need  
8 for the process to recognise the harm.

9 One of the most important functions of the Inquiry  
10 is to record the harm suffered by individuals and their  
11 families as a result of the twin disasters. That is not  
12 simply a case of recording the numbers of lives lost or  
13 the numbers infected, difficult though these two things  
14 are; it is also necessary to narrate the far-reaching  
15 consequences of infection and treatment on individuals  
16 and their families.

17 Chapter 4 of the preliminary report records the  
18 experiences of patients and their families. It seems to  
19 be entirely accurate.

20 In addition, during the evidential hearings we heard  
21 exceptionally powerful testimonies, from Amy, Christine,  
22 David, Elaine, Frances and Mark in relation in  
23 particular to HIV, and Alex, Anne, Bridie, Colin,  
24 Gordon, Laura and Stephen in relation in particular to  
25 Hepatitis C.

1           The Inquiry also has important evidence from experts  
2           on the effects of HIV and Hepatitis C, the effects of  
3           treatment and the consequences and effects of  
4           co-infection. It also has a considerable number of  
5           witness statements from patients and relatives who,  
6           although not called to give evidence, have taken the  
7           opportunity to tell their stories.

8           The Inquiry also has material from Jean Tamburrini,  
9           Roseleen Kennedy, as well as the statements from  
10          Mrs Black and Mrs Laing in relation to the individual  
11          deaths.

12          Further work is ongoing in relation to giving  
13          reliable figures for the numbers infected and the  
14          numbers of deaths as a result of treatment by the NHS in  
15          Scotland.

16          The Inquiry also has significant material in  
17          relation to the financial consequences of infection and  
18          co-infection. There is, therefore, every reason to be  
19          confident that the final report will carefully document  
20          all of the effects, so that a permanent, accurate record  
21          of the adverse consequences of the disasters suffered  
22          and continuing to be suffered by patients and their  
23          families will be available.

24          I would now like to make some remarks about certain  
25          themes that emerge from our submissions.

1           Our detailed written submissions expand upon some of  
2           the more contentious areas covered by the Inquiry. Some  
3           of the themes that emerge from those submissions should  
4           be highlighted. There are five of these in relation to  
5           HIV.

6           One, we say that the "business as usual" decision by  
7           senior haemophilia clinicians, and seen in the letter  
8           from Professor Bloom of May 1983, was wrong in the light  
9           of the available information at that time. Patients  
10          should have been offered different treatment from that  
11          point on.

12          Two, we say that there was complacency, at least for  
13          a time, that HIV was an American problem for which  
14          recipients of blood and blood products would be  
15          protected due to the voluntary donor system.

16          Three, we say that the Government, the Department of  
17          Health and Social Security, the Scottish Home and Health  
18          Department and the Scottish National Blood Transfusion  
19          Service and clinicians all publicly understated the risk  
20          posed to the blood supply from AIDS long after it must  
21          have been known that there was a significant danger.

22          It was represented in the press that the public had  
23          nothing to worry about, even after haemophiliacs in  
24          Edinburgh had tested positive for the presence of the  
25          virus.

1           Four, there was a failure to share information  
2           across disciplines. In 1983 the transfusionists were  
3           very concerned about the prospect that HIV had entered  
4           the donor population but they do not appear to have  
5           shared those concerns with the haematologists. The  
6           attitude of the latter might be summed up by the  
7           statement of one of them during the evidence, which was:

8           "We were not in the infectious diseases business."

9           One lesson that this Inquiry should be able to drive  
10          home to anyone interested is that treating patients with  
11          blood or blood products is very much being in the  
12          infectious disease business.

13          Five, time and time again blood samples were  
14          analysed without express knowledge or consent of  
15          patients providing those samples. This was a widespread  
16          practice that occurred in the West of Scotland as well  
17          as Edinburgh.

18          It was wrong, it was compounded by a failure to  
19          obtain express permission from patients to publish the  
20          results of continuing studies in relation to those  
21          samples, even yet permission in respect of work  
22          conducted in relation to samples obtained many years ago  
23          has not been sought. This practice has made  
24          a significant contribution to the anger and mistrust on  
25          the part of patients in relation to those responsible

1 for their long-term treatment.

2 In relation to Hepatitis C, I have seven points.

3 First, the most important point is the lack of  
4 appreciation on the ground of the threat from non-A  
5 non-B Hepatitis and the lack of action in response to  
6 the threat. No doubt the insidiousness of the disease  
7 meant that the danger was not fully appreciated but it  
8 was known from the mid-1970s that there were  
9 unidentified hepatitis viruses in the donor pool, and it  
10 was known from the early to mid-1980s that the virus  
11 known as "non-A non-B Hepatitis" would be likely to  
12 result in serious adverse consequences for patients.

13 It was also known from the early 1980s that blood  
14 products made from large donor pools would almost  
15 certainly transmit the virus.

16 Secondly, an unnecessary risk was taken by  
17 continuing to collect blood from prisons until early  
18 1984. The decision to leave it to regional transfusion  
19 directors to decide whether and when to stop collecting  
20 blood was wrong. In the light of the available  
21 evidence, a direction to stop collecting blood from  
22 prisons should have been taken nationally by the end of  
23 the 1970s at the latest. Such a decision would not have  
24 adversely affected the blood supply.

25 Three. Surrogate testing for non-A non-B Hepatitis,

1 as Hepatitis C was known, should have been introduced  
2 when the Scottish National Blood Transfusion Service  
3 made its recommendation to the Scottish Home and Health  
4 Department in March 1987.

5 The Scottish Home and Health Department  
6 underestimated the significant public health risk posed  
7 by non-A non-B Hepatitis and did not react urgently and  
8 adequately to the threat posed.

9 Four. It took far too long to introduce screening  
10 tests for Hepatitis C between the isolation of the virus  
11 in 1988 and their introduction in September 1991.

12 Scotland lagged considerably behind other countries  
13 in this regard. Japan, Australia, France, Finland, the  
14 United States, Germany, Canada, Belgium, Switzerland  
15 Italy, Norway, Sweden, Netherlands, Denmark, Malta and  
16 Cyprus, among others, all beat us to it. In the  
17 dithering that went on between 1989 and 1991, the SHHD  
18 and SNBTS lost sight of the interests of patients. As  
19 was put by Dr McClelland in his evidence:

20 "Nobody appeared to consider the question: what  
21 about the patients?"

22 Five. There was a failure to reduce to a minimum  
23 the risk to virgin and minimally-treated haemophiliac  
24 patients in the period between January 1986  
25 and April 1987, when Scottish Factor VIII was not

1 sufficiently heat-treated to inactivate the virus  
2 causing non-A non-B Hepatitis.

3 This was at a time when it was known that treatment  
4 with SNBTS Factor VIII would certainly infect a patient  
5 with that virus and that it was likely that such  
6 infection could result in cirrhosis of the liver,  
7 hepatic cancer and death.

8 Six. Look-back -- that is the tracing of the  
9 recipients of infected blood -- should have started when  
10 screening for Hepatitis C was introduced in Scotland in  
11 1991. As Dr Gillon of the SNBTS maintained at the time  
12 and maintained in his evidence:

13 "It was the ethical thing to do."

14 He was right then and he was right when he gave his  
15 evidence.

16 Seven. One of the most damaging aspects for  
17 patients has been the extent to which sufferers of  
18 Hepatitis C have been stigmatised as abusers of alcohol  
19 because of a failure by health professionals to  
20 appreciate the damage to the liver caused by the virus.  
21 This is an experience repeated time and time again in  
22 the case studies. The problem stems from a lack of  
23 appreciation of the long-term liver damage caused by the  
24 virus.

25 I do want to say something in relation to

1 communication which relates to both HIV and Hepatitis C.

2 The evidence of patients is clear that, one, they  
3 were not given sufficient information about the risks  
4 associated with treatment by blood and blood products;  
5 two, patients were not told that they were being tested.  
6 This occurred in relation to Hepatitis C, even after it  
7 must have been obvious that testing for HIV without  
8 consent was unacceptable from the point of view of  
9 patients.

10 Three. There were significant and unacceptable  
11 delays between a positive test for infection and that  
12 information being relayed to patients.

13 Four. Patients were given incomplete, inadequate  
14 and misleading information about the consequences of  
15 being infected with the virus.

16 Failure in communication occurred not just between  
17 doctor and patient, but also within medical disciplines;  
18 between the top and the bottom and across medical  
19 disciplines, between transfusionists and haematologists  
20 and haematologists and virologists.

21 I want to make some concluding remarks.

22 It would be wrong for anyone to think that the  
23 National Health Service can always offer relief from the  
24 heartache and the thousand natural shocks that flesh is  
25 heir to. Indeed, it is right that tribute should be

1           paid to all of the hard-working medical staff, all the  
2           hard-working fractionating staff, who provided treatment  
3           and products to patients during the time we have been  
4           examining.

5           Although a critical eye is cast in relation to  
6           certain decisions, it is right to record genuine and  
7           heartfelt gratitude for the excellent treatment received  
8           by patients much of the time.

9           But three key words are worth emphasising, and I do  
10          so in reverse order: service, health and national.

11          It is a service for the benefit of patients and  
12          their families. Their welfare should always be at the  
13          centre of all decision-making. The patient should be in  
14          control, not the health service professional. The  
15          essence of this is the autonomy of the patient.  
16          Decisions in relation to treatment and care are for the  
17          patient and, where appropriate, their carer.

18          Health. Decisions should always be taken in the  
19          best interests of promoting the health of patients.  
20          Some of the delays that occurred in Scotland were  
21          because other considerations overrode the interests of  
22          patient health, and we make specific reference to these  
23          instances in our submissions.

24          National. There are two points here. The first is  
25          the obvious regional variation in practices and

1 standards during the reference period. There was a lack  
2 of national direction and decision-making throughout.  
3 Standards of service varied throughout the country.

4 Dr Cachia's testimony that he was a bit horrified by  
5 what he found when he arrived in Dundee in 1992, to find  
6 that Hepatitis C testing was being carried out on  
7 patients' stored samples without consent being obtained,  
8 is one example of many regional variations in standards.

9 The second point is the failure of the  
10 Scottish Health Service, legally and administratively  
11 autonomous as it was, to make decisions for itself.  
12 There were many situations, such as the delays in the  
13 introduction of donor screening and surrogate testing  
14 and look-back of HCV to name but three, where the  
15 decision not to implement these things was taken so as  
16 to avoid stepping out of line with the rest of the  
17 United Kingdom.

18 This is not a political point but where the NHS in  
19 Scotland has the autonomy, and we most certainly do not  
20 accept that it did not have the autonomy at the relevant  
21 time. If it's right to do something or follow  
22 a particular course of action in the interests of  
23 patient safety, then it should get on and do it and not  
24 wait for a lead from anywhere else.

25 Sir, you have heard many harrowing stories from

1 patients who suffered the terrible consequences of HIV  
2 or Hepatitis C, and in the case of haemophiliacs  
3 frequently both. You heard of mothers, who, as carriers  
4 of haemophilia, had to come to terms not only with  
5 passing on the condition to their son, but then  
6 administering what they thought was life-transforming  
7 medication only to realise that their child had been  
8 infected with HIV, and then they had to stand by and  
9 watch as the child fell ill and died.

10 The twin disasters have really happened to real  
11 people. They needed and need support. Many of them  
12 have suffered significant deteriorations in their  
13 conditions since the start of this process. They needed  
14 and need understanding, they needed and need  
15 explanations, and they needed and need mistakes to be  
16 acknowledged and improvement to be made.

17 I am confident that the Inquiry will do what it can  
18 in fulfilling its terms of reference to meet those  
19 needs.

20 Thank you.

21 THE CHAIRMAN: Mr Anderson?

22 Submissions by MR ANDERSON

23 MR ANDERSON: Thank you, sir.

24 Today's final hearing has been long awaited. It is  
25 almost three years to the day since the preliminary

1 hearing in this Inquiry was held at Edinburgh  
2 International Conference Centre on 31 March 2009.

3 Since then, the first phase of the Inquiry has  
4 resulted in the publication of the preliminary report, a  
5 notable achievement in itself and the result of an  
6 in-depth analysis by you, sir, as chairman of this  
7 Inquiry and the Inquiry team of the great mass of  
8 documentation recovered under the Inquiry's terms of  
9 reference from numerous sources, including both the  
10 SNBTS and the Scottish health boards.

11 The second phase, the oral hearing, started  
12 approximately one year ago on 8 March 2011 and concluded  
13 on 20 January this year.

14 It has been apparent throughout this period to all  
15 those involved that the Inquiry team has been extremely  
16 diligent in its research into what are matters of  
17 considerable scientific and medical complexity. In the  
18 first place, therefore, I should wish to express my  
19 appreciation on behalf of NHS Scotland of the Inquiry  
20 team's dedication and also the very competent manner in  
21 which it has carried out this challenging task.

22 It is also appropriate to record appreciation to  
23 both those bereaved relatives who gave evidence in  
24 relation to the specific deaths and to the anonymised  
25 witnesses who gave evidence regarding the effects of

1 living with either HIV or Hepatitis C, or both viruses.

2 It requires little imagination to appreciate how  
3 difficult it must have been for those individuals to  
4 give evidence before this Inquiry about such painful  
5 events and with such admirable restraint and dignity.

6 Next, it is appropriate, I think, to record  
7 appreciation of other witnesses who gave oral evidence  
8 to the Inquiry, and particularly those who attended  
9 despite their advanced age.

10 Some witnesses gave evidence on more than half  
11 a dozen occasions. Two witnesses, I think, each making  
12 as many as ten appearances. Many were in their 70s,  
13 some in their 80s, and much of the time were having to  
14 recollect events that took place 30 or so years ago.

15 I'm sure that everyone involved in the Inquiry will  
16 agree that all of the many witnesses from whom the  
17 Inquiry took evidence displayed a real commitment to  
18 assist the Inquiry in its investigations. Of course,  
19 many were giving evidence about what was effectively  
20 their life's work.

21 Notwithstanding the difficulties presented by the  
22 passage of time, the fact that some key participants  
23 have died and the wide-ranging nature of this Inquiry,  
24 there seems little doubt that the thoroughness with  
25 which this Inquiry has been undertaken should provide

1 all those with an interest in the subject with  
2 a definitive statement in the form of the final report.

3 None of the previous Inquiries held in this and  
4 other countries have gone into such depth of detail  
5 about both treatment and scientific issues as has the  
6 present Inquiry.

7 For this reason it is hoped that this Inquiry will  
8 provide the foundation for a new, more balanced and  
9 evidence-based understanding of events in the past.

10 In this regard it has, in recent weeks, been  
11 disappointing to see that even after the conclusion of  
12 hearing almost a year of oral evidence, there are still  
13 those who persist in describing the subject matter of  
14 this Inquiry, in a media context, as "a scandal".

15 No doubt some will say, and indeed has just been  
16 said, that certain things might have been done  
17 differently or that different decisions might have been  
18 taken. That may or may not be correct. But of this  
19 there should be no doubt: there is no justification for  
20 the description of events as "a scandal". There is and  
21 was no scandal. That word always carrying with it the  
22 connotation of wrongdoing of one sort or another.

23 It may be appropriate now to comment briefly on the  
24 synopsis presented just now by my learned friend  
25 Mr Di Rollo of the criticisms contained within their

1 very full written submissions. I would propose to deal  
2 with only those that might be regarded as the more  
3 controversial.

4 Starting in relation to HIV, there is repeated  
5 criticism made in relation to testing without consent.  
6 This is a criticism that is now made but significantly  
7 was never apparently made at the time. This is, in my  
8 submission, perhaps the most obvious case of looking at  
9 events of the early 1980s through 2012 spectacles.

10 Careful analysis of the evidence from independent  
11 expert witnesses will, I suggest, confirm that there  
12 should be no criticism of clinicians who tested stored  
13 samples in what was considered to be their patients'  
14 best interests, and it is, in my submission, not  
15 justified to characterise that practice as "wrong". It  
16 may be wrong by present day standards but it was not  
17 wrong by the standards of the early 1980s.

18 In relation to Hepatitis C, dealing with surrogate  
19 testing, it's important to appreciate that there was  
20 never at any time any consensus on the usefulness of  
21 surrogate testing. To suggest now that just because it  
22 was not introduced, it should have been introduced is  
23 simply not accepted. But, sir, you have the full  
24 submissions in relation to that, both of course on  
25 behalf of the NHS and the submissions on behalf of the

1 Scottish Government.

2 In relation to donor screening, again, the criticism  
3 is not accepted. Despite what my learned friend has  
4 just suggested, the world was different then. This was,  
5 of course, a pre-devolution era. Health is now  
6 a devolved matter. Then Scotland had no autonomy. The  
7 introduction of donor screening was a large national  
8 exercise in which the Department of Health naturally  
9 took the lead. Again, it's perhaps sufficient to refer  
10 to the written submissions of the NHS, and indeed again  
11 of the Scottish Government, on this point.

12 We can perhaps now look back from 2012 and see, as  
13 counsel to the Inquiry very aptly put it, that a number  
14 of small delays may have added up to a bigger one. But  
15 the suggestion that SNBTS had the power to cause  
16 a departure from the well recognised status quo, in my  
17 submission ignores the realities of the situation and  
18 the suggestion within the written submissions that this  
19 was an abrogation of responsibility by SNBTS is to  
20 misunderstand the role of the SNBTS.

21 Finally, in relation to the criticism, caution,  
22 I think, requires to be exercised in relation to the  
23 difficult topic of communications between doctors and  
24 patients.

25 The difficulty, I would suggest, is that the

1 criticisms that my learned friend Mr Di Rollo makes are  
2 predicated upon simply accepting everything that the  
3 patients say is right, and I would simply suggest to  
4 you, sir, that facts are not as simple as that.

5 It has also been noted that the written submissions  
6 made to the Inquiry on behalf of the patient interest  
7 core participants make repeated criticisms based on  
8 suggested alternative strategies or treatment which were  
9 never explored with any witnesses in evidence. These  
10 submissions and what it is said should have been done  
11 represent an exercise in hindsight which frequently  
12 ignores the totality of the evidence.

13 The fact is that there are risks associated with all  
14 medical procedures and the transfusion of blood and use  
15 of blood products are no different. Despite the  
16 considerable number of blood transfusions carried out in  
17 Scotland every year, the possibility of transmission of  
18 an unidentified infective agent, which is naturally  
19 present in the human population, is rare; nevertheless,  
20 this rare risk is inherent in treatment with blood and  
21 blood products.

22 Also, in the context of media coverage, it should be  
23 stressed that the use of the term "contaminated blood"  
24 is a misnomer insofar as that term implies that  
25 something has been added to blood.

1           Both HIV and Hepatitis C are naturally occurring  
2           blood-borne viruses and the vast majority of patients to  
3           whom these viruses were transmitted were infected before  
4           the viruses had been discovered by medical science,  
5           before medical science had devised tests to detect these  
6           viruses and before it was possible to screen blood  
7           donors.

8           Across the world, making blood and blood products  
9           safe from these viruses represented significant  
10          milestones in the advance of transfusion science and  
11          transfusion medicine.

12          In this global sense, Scotland not only played its  
13          part in these advances but was at the forefront  
14          including being, firstly, one of the first countries in  
15          the world to provide Factor VIII concentrate from its  
16          own donor population in sufficient quantities to treat  
17          its own patient population; an achievement described by  
18          the Inquiry's expert, Professor van Aken from the  
19          Netherlands, as "remarkable" and "a real big success".

20          Secondly, Scotland was the first country to supply  
21          sufficient heat-treated Factor VIII concentrate safe  
22          from HIV.

23          Thirdly, it was the first country to supply  
24          sufficient heat-treated Factor VIII concentrate safe  
25          from Hepatitis C long before the major commercial

1 companies did.

2 Fourthly, it made Factor VIII and Factor IX  
3 concentrates safe from Hepatitis C, even before the  
4 virus had been isolated; and finally, it was one of the  
5 first countries to conduct a Hepatitis C look-back  
6 exercise.

7 Although the achievement of making blood and blood  
8 products safe from the transmission of HIV and  
9 Hepatitis C represented significant medical advances,  
10 nevertheless it is a highly regrettable but unavoidable  
11 fact that whenever such advances exist in medicine,  
12 there will always be patients who are unable to benefit  
13 from the development having been treated at an earlier  
14 time.

15 Following on from these advances of the 1980s and  
16 early 1990s, there have many further significant  
17 developments in the safety of blood and blood products  
18 provided to Scottish patients. To give but one example:  
19 following the licensing in the UK of commercial  
20 recombinant non-human factor concentrates in 1995,  
21 Scotland achieved their routine use several years before  
22 the rest of the UK.

23 Developments such as these have not been able to be  
24 explored in evidence having been considered by the  
25 Inquiry team to fall outwith the historical scope of

1 this Inquiry as set out in its terms of reference.

2 It should not be forgotten that the development of  
3 concentrates prolonged the lives of many patients with  
4 haemophilia and greatly enhanced their quality of life;  
5 nor should it be forgotten how difficult a position  
6 haemophilia clinicians found themselves in when faced  
7 with the dilemma of continuing to treat their patients  
8 against the background of the emergence of HIV,  
9 a totally new and unprecedented fatal virus, and one  
10 about which medical science was initially divided as to  
11 its origin and its mode of transmission.

12 Equally, haemophilia clinicians faced further  
13 challenges due to the emerging knowledge throughout the  
14 1980s of the consequences of non-A non-B Hepatitis,  
15 later identified and described as "Hepatitis C".

16 In his evidence, another of the Inquiry's experts,  
17 Professor Lever, expressed the opinion that:

18 "During the emergence of HIV there would not have  
19 been an expert there at the time who could justifiably  
20 have said what was going to happen with HIV, far less go  
21 on to specify what clinicians must do."

22 As Inquiry witness Professor Forbes, formerly of  
23 Glasgow Royal Infirmary, put it, it was certainly not  
24 possible to stop the use of concentrate as bleeding  
25 would have resulted in death.

1           As events unfolded around HIV, it was the dedicated  
2           efforts of the haemophilia clinicians, and in particular  
3           the close monitoring of their patients, which resulted  
4           in early confirmation that HIV had entered the Scottish  
5           donor population, which resulted in a swift and  
6           effective response from the SNBTS in terms of virus  
7           inactivation.

8           Whilst in no way minimising the devastating outcome  
9           for the patients who acquired HCV, Hepatitis C and/or  
10          HIV, the low rate of infection in Scotland by  
11          international standards stands as testimony to both the  
12          efforts of the SNBTS to make blood for transfusion and  
13          blood products as available and safe as possible and  
14          possible for clinicians to use blood and blood products  
15          wisely and only where necessary.

16          The SNBTS has always been driven by the commitment  
17          to save and improve lives and counter illness while  
18          fully supporting its donors. It has worked tirelessly  
19          throughout its history to provide sufficient, safe and  
20          effective treatment for all patients who require  
21          life-saving blood and blood products. The development  
22          of such life-enhancing treatment has always posed  
23          challenges to which the SNBTS has consistently faced up  
24          as and when they arise.

25          Equally, Scottish clinicians have at all times been

1 driven by what they considered to be in their patients'  
2 best interests. The evidence before this Inquiry has,  
3 in my submission, demonstrated that they acted in good  
4 faith to administer what they in their clinical judgment  
5 considered to be the best available care.

6 These events had a profound and lasting effect on  
7 those working within the SNBTS and on the medical and  
8 nursing staff within the health boards, who dedicated  
9 their professional lives to the development of safe  
10 products and to the care of their patients.

11 It is a matter of the greatest regret to NHS  
12 Scotland that patients were infected with the HIV and  
13 Hepatitis C viruses as a result of medical treatment,  
14 and every sympathy is extended to those infected and  
15 perhaps, above all, to the bereaved relatives.

16 Finally, as previously noted, this Inquiry has dealt  
17 with events which occurred some 30 or so years ago.  
18 This should not detract attention from the fact that  
19 blood testing and processing systems used in Scotland  
20 today provide extremely high levels of safety and that  
21 NHS Scotland continues now, as before, to rely heavily  
22 upon blood donations given voluntarily by the people of  
23 Scotland.

24 In Scotland around 50,000 patients every year  
25 receive life-saving blood transfusions. Accordingly, it

1 remains as vital now as it always has been for donors to  
2 continue to support the Scottish National Health Service  
3 in caring for the people of Scotland.

4 Thank you very much, sir.

5 THE CHAIRMAN: Thank you, Mr Anderson. Mr Johnston?

6 Submissions by MR JOHNSTON

7 MR JOHNSTON: It was on 23 April 2008 that the Cabinet  
8 Secretary for Health and Wellbeing announced to the  
9 Scottish Parliament the establishment of this Inquiry.

10 The Government was conscious that the transmission  
11 of Hepatitis C and HIV through blood and blood products  
12 was a tragedy that had blighted the lives of many people  
13 in Scotland. Nothing could ever make amends to those  
14 people or their families for that but it was recognised  
15 that they were entitled to an explanation of how  
16 Hepatitis C and HIV came to be transmitted through NHS  
17 treatment in Scotland.

18 The setting up of this Inquiry reflects the policy  
19 that informs the whole NHS in Scotland nowadays to offer  
20 healthcare which is safe, effective and focused on  
21 patients.

22 In the spirit of that policy, it is important to  
23 provide explanations when things have gone wrong and  
24 assurance that lessons will be learned for the future.

25 Even at the outset, it was clear that the Inquiry

1 had an enormous task before it. It would have to carry  
2 out a detailed investigation into the circumstances in  
3 which Hepatitis C and HIV were transmitted through the  
4 blood and blood products used in NHS treatment.

5 It would have to consider whether, in light of the  
6 epidemiological and scientific knowledge available at  
7 the relevant times, all that could be done to protect  
8 the public had been done.

9 It would have to explore the consequences of  
10 transmission of these viruses for the patients affected.  
11 This would involve reconstructing events going back as  
12 far as 1974 with such help as witnesses could still  
13 provide and by reference to voluminous quantities of  
14 documentation which the government and other bodies  
15 would supply to the Inquiry.

16 By the time of the announcement in April 2008, many  
17 key documents were already in the public domain. There  
18 had also been a number of previous inquiries and  
19 investigations into the issues. But those inquiries,  
20 valuable though they were, were carried out by  
21 Government and lacked independence.

22 The Government recognised that it was essential to  
23 have an investigation which had the credibility and  
24 authority of a full and transparent Scottish public  
25 Inquiry.

1           Since the Inquiry was established, it has had the  
2           total support of the Scottish Government. While the  
3           Government has taken part as a core participant in the  
4           Inquiry, it has nonetheless respected the need for the  
5           Inquiry to be absolutely independent.

6           At this stage, after publication of the preliminary  
7           report in 2010 and after the completion of 88 days of  
8           oral hearings in 2011 and 2012, it is to the chairman of  
9           the Inquiry and the whole Inquiry team that particular  
10          thanks are due.

11          These thanks are not limited to those who are  
12          visible in the hearings, but extend to all those who  
13          have provided essential support behind the scenes. The  
14          Government is extremely grateful to the chairman and the  
15          Inquiry team as a whole for the extraordinary amount of  
16          work and commitment that they have devoted to  
17          identifying, investigating and analysing the issues.

18          The magnitude of the work facing the Inquiry has  
19          already been mentioned. In that context, the Government  
20          would also wish to express its appreciation of the fact  
21          that the Inquiry has succeeded in investigating so many  
22          complex issues so thoroughly.

23          It also pays tribute to the considerable efforts  
24          that the Inquiry has made to ensure the openness and  
25          transparency of its proceedings, not least by making it

1 possible to follow them from day to day on the Inquiry  
2 website.

3 Equally, it recognises the great efforts that the  
4 Inquiry has made to respect the privacy of the  
5 courageous individuals who came forward to give first  
6 hand accounts of their experiences of HIV and HCV.

7 As the Cabinet Secretary has previously  
8 acknowledged, nobody can undo the pain and suffering of  
9 the people who were affected by HIV or Hepatitis C as  
10 a result of treatment with blood and blood products; but  
11 they can be offered an explanation and they can be  
12 provided with assurances that lessons can be learned.

13 The Government expresses the hope that the Inquiry,  
14 when it reaches its final conclusion, will provide that  
15 explanation and those assurances. It therefore looks  
16 forward to receiving the final report and  
17 recommendations in due course.

18 Thank you.

19 THE CHAIRMAN: Ms Dunlop?

20 Submissions by MS DUNLOP

21 MS DUNLOP: Thank you, sir.

22 There are two principal areas I wish to address in  
23 my remarks.

24 Firstly, I should explain that the team of Inquiry  
25 counsel has itself produced a list of issues relating to

1 each numbered topic. This is at [\[PEN0190843\]](#). These  
2 were the matters that seemed to us as Inquiry counsel to  
3 be the main points arising under each topic. We drafted  
4 these lists in the hope that they would be of assistance  
5 in the preparation of the final report.

6 We have not, however, proposed how those questions  
7 should be answered because they relate in many instances  
8 to issues which are controversial, and it appeared to us  
9 to conflict with our position of neutrality to advance  
10 submissions as to how controversial issues should be  
11 resolved.

12 At this point, I should refer to the matter of  
13 statistics. There is work ongoing, in particular in  
14 relation to the attempt to establish the number of  
15 people who acquired Hepatitis C as a result of blood  
16 transfusion. We will continue to keep all core  
17 participants informed of the progress of that work,  
18 which I hope will be concluded in reasonably early  
19 course.

20 In relation to statistics, I should also take this  
21 opportunity to correct an impression given by the  
22 transcript at the end of the day on 18 January 2012. In  
23 fact at that point Professor Goldberg of  
24 Health Protection Scotland had provided the Inquiry with  
25 further information on statistics, as he undertook to do

1 in his evidence last March, and had carried out  
2 extensive work in doing so.

3 The second area I want to address is in relation to  
4 the phase of the Inquiry which began when we took  
5 occupation of these premises, I think at the end of  
6 2010. That phase, the hearings phase, followed a period  
7 of preparation during which the Inquiry team published  
8 the preliminary report. It would not be controversial  
9 to describe this hearings phase as "phase 2".

10 A great deal of effort on the part of many people in  
11 the Inquiry team has contributed to phase 2, and on  
12 behalf of Inquiry counsel I would like to thank those  
13 individuals.

14 Firstly, I must acknowledge, sir, on behalf of us  
15 all, your own industry in devoting so much time and  
16 effort to staying abreast of the evidence throughout.

17 In addition, your flexible approach to matters of  
18 timing and of procedure has greatly assisted in the  
19 running of the hearings. Professor James, the medical  
20 assessor, is not here today, but, of course, his  
21 willingness to help us all with the many incidental  
22 medical questions as they arose has been much  
23 appreciated.

24 To all the lawyers who have represented all the core  
25 participants, we express our sincere gratitude. We did

1 not always agree but the unfailing courtesy and good  
2 humour shown by everyone in the front rows has made the  
3 experience very much better than it could have been.

4 Our own solicitors, Douglas Tullis and Louyse  
5 McConnell-Trevillion, have kept us on the straight and  
6 narrow, we hope, and dealt with the reams of  
7 correspondence and probably a million emails. We thank  
8 you from the bottom of our inboxes for reliving us of  
9 that burden.

10 Our Inquiry secretary, Maria McCann, has helped at  
11 every turn, as have Sarah and Meg, and, normally back at  
12 Drumsheugh Gardens, Kate Miguda and Charles Rogers. The  
13 can-do attitudes displayed by all of you have been  
14 remarkable.

15 Margaret Fraser, as well as looking after witnesses  
16 throughout, has supplied us with multi-coloured witness  
17 availability spreadsheets, which were indispensable.  
18 I should of course acknowledge that the other half of  
19 that, the witnesses making themselves available to us,  
20 has also been something that we could not have done  
21 without.

22 We have been well catered for literally, too; Scott  
23 and Raymond, our security guards, have trudged out in  
24 all weathers, every day, for our lunches, as well as  
25 discharging their duties at the front desk and looking

1 after my bike every time I forgot my lock.

2 Our documents team have remained cool, calm and  
3 efficient at all times, despite, in their own words,  
4 having to "paddle madly below the surface" from time to  
5 time.

6 External contractors have also provided high quality  
7 assistance throughout, insofar as the task of assembling  
8 and displaying our many documents is concerned.

9 Neil, Ollie and Keith, court book stands as  
10 a monument to you all, to say nothing of the behemoth  
11 that is Signature, lying beneath. Our stenographers,  
12 who have provided the transcripts, Stuart and Catherine,  
13 have served us without fail and have produced the best  
14 transcripts I have ever seen. I do hope that even  
15 a small amount of the arcane vocabulary will be useful  
16 to you some day, somewhere.

17 Focusing more closely on the presentation of  
18 evidence brings me to the topics teams, Gregor Mair,  
19 Lindsey Robertson, Janet Marsh, Angus Evans,  
20 Gemma Lovell and Yasmin Shepherd, the lawyers who have  
21 assisted us. We simply could not have managed without  
22 you. Your knowledge of your own tranches of time within  
23 the Inquiry period from the documents exercise enabled  
24 you to move seamlessly to the in-gathering of statements  
25 and other material for the hearings. The preparation of

1 inventories and the assembly of folders for us all and  
2 your thoroughly dependable input on a range of tasks has  
3 massively assisted throughout phase 2.

4 Finally, I have for the first time in my career, had  
5 three junior counsel. I have never had it so good.  
6 Jane Patrick, Euan Mackenzie and Nick Gardiner have  
7 worked tirelessly and offered ceaseless support. All  
8 four of us have learned much during this exercise and it  
9 has been a privilege for us all to serve as Inquiry  
10 counsel.

11 Closing Statement from THE CHAIRMAN

12 THE CHAIRMAN: Ladies and gentlemen, you have heard quite  
13 diffusive thanks offered to many people, often with  
14 names that will mean absolutely nothing to you. I will  
15 have my opportunity to express my thanks to all those  
16 who have contributed to the work of the Inquiry in due  
17 course and I won't repeat that now.

18 It will be clear from what you have heard this  
19 morning that there is a great deal now to do to bring  
20 the Inquiry to a conclusion. There has been  
21 a staggering amount of evidence. All of it will have to  
22 be looked at, all of it will have to be analysed so far  
23 as it bears on the critical issues that still have to be  
24 resolved.

25 There are some issues of basic fact, there are some

1 issues of inference from fact and some impressions and  
2 it will not be possible to accept all the evidence as  
3 credible and reliable, although we have to say in this  
4 case reliability is likely to be the issue rather than  
5 credibility, which often causes trouble in litigation,  
6 which is not, of course, this case.

7 These investigations of the evidence, discussions  
8 and analysis, they will take time. I can't promise to  
9 produce a final report in a period of time that is  
10 shorter than necessary to ensure that the end product  
11 reflects the value of the input material, but it will be  
12 done as soon as reasonably practicable.

13 While I don't want to take time thanking all of  
14 those who have contributed to the exercise, I do want to  
15 express my deep gratitude to all of those who have  
16 attended and given evidence at this Inquiry. Those who  
17 have never given evidence hardly ever understand the  
18 demands that appearing before any sort of tribunal make  
19 on the individuals involved. Whether they are  
20 professionals, whether they are individuals directly and  
21 personally affected by the events, giving evidence is  
22 not easy for them.

23 It is particularly difficult, of course, for those  
24 who come to give personal accounts of experiences that  
25 have affected their lives very deeply, and that applies

1 principally to patients. It also applies, as has become  
2 clear, to some of the clinicians who have been directly  
3 involved in patient care.

4 I am very, very grateful that people have been  
5 willing to come forward.

6 I don't want anyone to underestimate the extent to  
7 which this Inquiry has been assisted, particularly by  
8 patients and by families of patients, in coming to give  
9 statements on which we can develop a picture of the  
10 impact of these diseases on people's lives. So I thank  
11 all of you really very deeply for the work that you have  
12 done, the preparations that you have made and for the  
13 willingness that you have shown, where you have been  
14 invited to do so, to come and give oral evidence to the  
15 Inquiry.

16 We are now at the end of the gathering of evidence,  
17 with one exception. Ms Dunlop has referred to it, the  
18 need to tighten up and reach a final conclusion on the  
19 statistical material available to the Inquiry, to assess  
20 the extent to which there are still people in the  
21 community in Scotland with Hepatitis C that is related  
22 to their treatment, so that the government can be  
23 informed of the extent of the continuing problem, a very  
24 important aspect of this Inquiry's work and one in  
25 respect of which I am personally less than happy to

1 reach a final conclusion without being satisfied that we  
2 have at least tried to identify the stones and turned  
3 them over, even if we don't manage to find all that  
4 lurks underneath.

5 With that exception, statement taking is at an end  
6 and evidence-gathering is completed. It now is for  
7 Professor James, for myself and for the Inquiry team to  
8 settle down and reach a concluded view on the very many  
9 issues that have been left for us to determine in the  
10 light of all that has been said and done.

11 Thank you all very much for your contributions.

12 (11.11 am)

13 (The hearing adjourned)
