Dear SAMO

## TRENDS IN THE TREATMENT OF HAEMOPHILIA

Antihæmophilic globulin (AHG) concentrate is in many instances the therapeutic agent of choice in the treatment of hæmophilic patients.

The production of the human concentrate in the UK is at present insufficient to meet the stated needs of clinicians who care for patients requiring surgical, including dental, treatment or who have episodes of severe bleeding. The indications are that considerably more of this preparation would be used if it were available.

Product licences have very recently been granted to two firms which enable them to market foreign human AHG concentrate to hospitals and hæmophilia centres in the UK. It has come to the notice of the Department that one of the firms is already engaged in active promotion of this expensive product. The firm has indicated that they can supply large quantities of human AHG concentrate and this could result in very significant expenditure if amounts were bought in excess of immediate needs.

In view of several developments in the management of patients with hæmophilia the Department has decided to assemble a group of experts who will advise on likely trends in methods of treatment, possible future requirements for the treatment of the condition and the consequences for the supply of therapeutic agents, including human AHG concentrate.

The conclusions reached will be the basis for realistic planning for the future which may well include an increase in the UK production of the preferred therapeutic agent.

The Department hope to let you have a further statement soon. Meanwhile, in view of the impending availability of foreign human AHG concentrate and its very high cost, you may like to let all concerned with the treatment of hæmophilia in your region know what is happening.

I am sending copies of this letter directly to the Directors of Hæmophilia Centres and also to Secretaries of Boards of Governors and of Regional Hospital Boards.

Yours sincerely

  
Chief Medical Officer
